

Demo Perovskite Solar Cell Study

Abstract

The MAPbI₃ device prepared by spin coating achieved a PCE of 21.3% under AM 1.5G illumination.

A FAPbI₃ sample showed a stability retention of 92% after 1000 h in nitrogen.

The SnO₂ transport layer reduced the RMSE of the calibration model to 0.12 eV on the test set.

Method

Devices were fabricated by spin coating and annealing with SnO₂ as the transport layer.

Results

The chromophore showed an absorption wavelength of 336 nm in acetonitrile.
